As of now, I have not got a chance to work on any application, but in my previous company (Meril Life Sciences Pvt. Ltd.), I got a chance to work on the Meril Engage App (iOS) UI in the storyboard.

The app is for medical students, In this app, there are video lectures related to their field and hands one tutorials of how to perform a certain surgery, In this app, users can find the medical books, and also buy the surgery kits from the app.

In the app, I have worked with the storyboard and developed the screens as per the designs.

In this app there is FAQ screen designed by me but when I was implementing that screen that was the most challenging part of this task, In the design on FAQ screen, When the user tap on the FAQ cell it should expand and show the related answer. I done some research on stackoverflow and other websites to find the similar functionality that can help me implement this functionality on this application as per my need.

Kindly refer the Meril Engage video clip
